

## **Supplementary information**

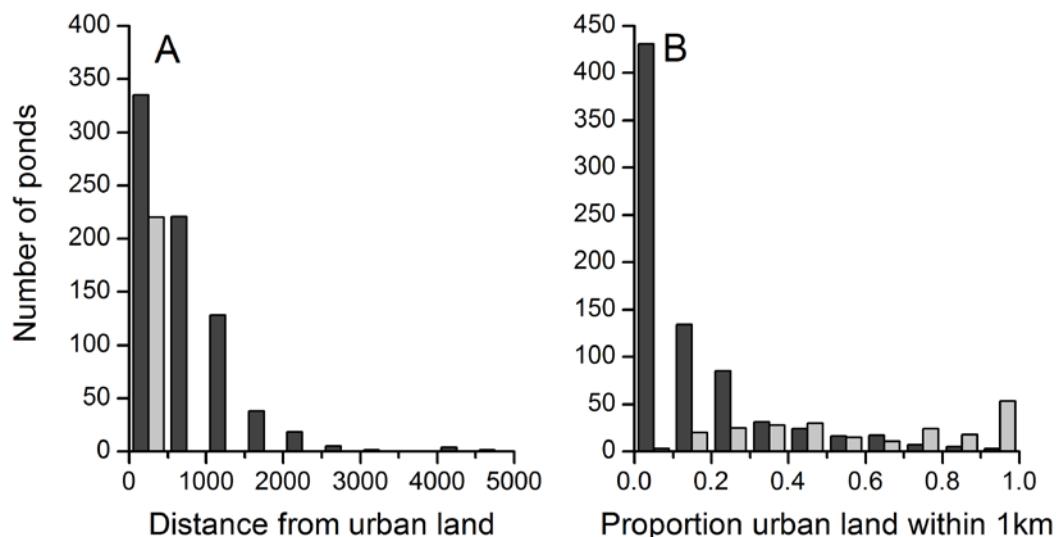

In this document we present additional data and analyses. **Part 1** demonstrates the differences among three different methods to describe urban ponds. **Part 2** provides the same analyses as in the main paper but for a subset of sites that exclude sites recorded as “degraded”. **Part 3** contains the tables of species prevalence across urban and non-urban ponds.

### Part 1: Definitions of “urban ponds”

In the main text we characterise urban ponds as those which are located within developed urban land use areas (DLUAs), areas of urban land demarcated by the UK Ordnance Survey mapping authority. However, we acknowledge that there are alternative methods to classify urban ponds and we provide a comparison with two such measures below:

1. Distance to urban area: The distance was calculated between each pond and the nearest urban land use area, where ponds within urban land use areas were allocated a value of 0 km.
2. Urban landcover in a 1 km buffer: Each pond was buffered to a distance of 1 km (a buffer area of  $3.14 \text{ km}^2$ ) and the proportion of that buffer containing urban land use was calculated.

Figure S1 shows the relationship between a binary categorisation of sites (as used in the main text) and these two alternative measures of urbanness. We further define additional threshold values for “urbanness” based on the distance from urban areas and the percentage of the 1 km buffer containing urban land (Table S1). To test for the sensitivity of our findings to these different definitions of “urban”, we carried out supplementary sensitivity analysis which is presented below for alpha diversity and gamma diversity.

*Figure S1: Comparison of three measures of pond classification. (A) shows the distance of each pond from the edge of a developed land use area (DLUA, see main text for details) for “urban” (light grey bar) and “non-urban” (dark grey bar) ponds as classified by their presence inside or outside of the DLUAs. (B) shows the proportion of urban land within a circular buffer of radius 1 km for the urban and non-urban ponds. Note that the urban ponds shown in (A) are all 0 km from urban land as they lie within the DLUAs.*

*Table S1: Threshold values for the definition of a pond as “urban”, with sample sizes of urban and non-urban pond derived for each threshold.*

Assumption	Definitions of urban pond	Species		Family	
		Urban	Non-urban	Urban	Non-urban
1	Within urban land use area	574	203	607	229
2	<500m from urban land use area	448	329	503	333
3	<1000m from urban land use area	628	149	686	150
4	100% urban land cover in 1 km buffer	23	754	28	808
5	>80% urban land cover in 1 km buffer	63	714	81	755
6	>60% urban land cover in 1 km buffer	115	662	140	696
7	>40% urban land cover in 1 km buffer	186	591	230	606
8	>20% urban land cover in 1 km buffer	328	449	379	457

### Alpha diversity

Methods: Mann-Whitney U tests were used to test for a difference in recorded taxon number (families and species) in urban and non-urban ponds under several definitions. Spearman rank correlations were used to test for an association between alpha diversity and (i) the distance to the nearest urban land use area, and (ii) the area of

Results: There were no significant correlations between alpha diversity at the species level and the distance to urban area ( $\rho=0.053$ ,  $p=0.138$ ) or the percentage of the 1 km containing urban land use area ( $\rho=-0.051$ ,  $p=0.156$ ), or between alpha diversity at a family level and the distance to urban area ( $\rho=-0.018$ ,  $p=0.594$ ) or the percentage of the 1 km containing urban land use area ( $\rho=0.023$ ,  $p=0.511$ ). When ponds were classified as either urban or non-urban according to the criteria in Table S1, there were only two assumptions that produced a significant difference between urban and non-urban species-level richness and both results were only marginally significant ( $p>0.025$ ; Table S2). One of these assumption (4) resulted in only 23 urban ponds compared against 754 non-urban ponds. None of the assumptions produced a significant difference in family-level richness.

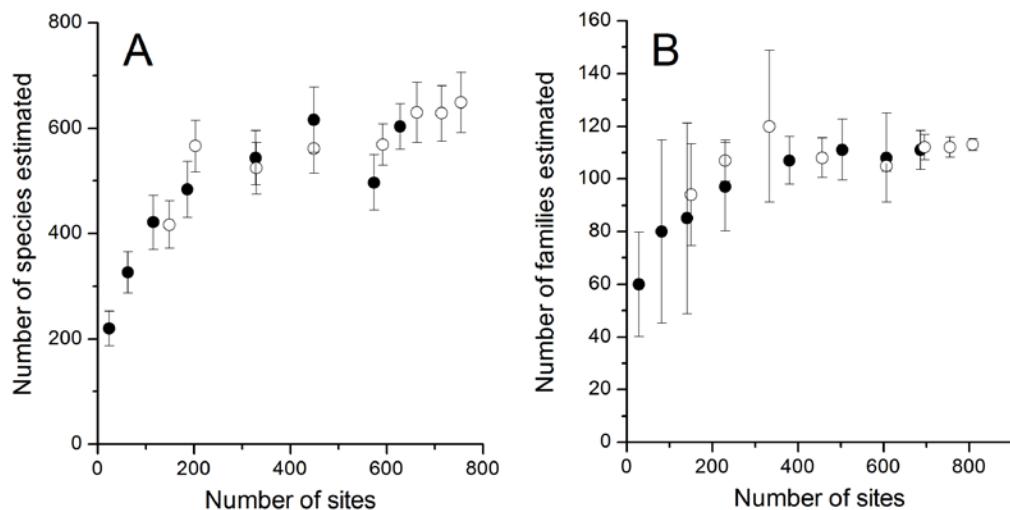

*Table S2: Sensitivity analysis showing the variation in alpha diversity in ponds categorised as “urban” or “non-urban” using different thresholds (see Table S1 for definitions of the assumptions), with results of Mann-Whitney U-tests.*

Taxonomic level	Assumption	Urban alpha	Non-urban alpha	W	p
Species	1	24	27	62043	0.169
	2	26	27	72544	0.709
	3	27	26	45898	0.719
	4	17	27	10996	0.028
	5	22	27	24548	0.229
	6	23	27	39495	0.520
	7	23	27	60841	0.028
	8	25	27	78276	0.133
Family	1	13	13	65476	0.196
	2	13	13	79710	0.237
	3	13	12	46680	0.075
	4	12	13	11716	0.748
	5	13	13	29253	0.521
	6	13	13	46038	0.303
	7	13	13	68562	0.717
	8	13	13	85828	0.824

## Gamma diversity

**Methods:** Gamma diversity was calculated for ponds classified according to the criteria in Table S1 using Chao's estimator from the *specpool* function in the *vegan* (Oskanen *et al.*, 2007) package in R (R Core Team, 2015). Significant differences were evaluated using the overlap of the 95% confidence intervals associated with the estimates of taxonomic richness.

**Results:** There were four assumptions that led to a significant difference (lack of overlap between 95% CIs) in species-level gamma diversity: Assumption 3 suggested a higher number of taxa in urban ponds, while Assumptions 4, 5 and 6 suggested a higher number of taxa in non-urban ponds (Table S3). In each of these cases the sample with the small number of taxa also had a far smaller number of sites (<20% of the number of sites as in the other sample; see Table S1). Indeed, even though the Chao estimator nominally controls for sample size, the Chao value correlates strongly with sample size, suggesting that the only fair comparisons occur when sample sizes are more similar (Assumptions 1, 2, 7 and 8, Figure S2). A similar pattern is also seen in the family data, but only Assumption 4 produced a significant difference between the gamma diversity estimates.

*Figure S2: Chao estimates ( $\pm 95\%$  CI) for the different assumptions made concerning the definition of an "urban pond". Data are shown in relation to the number of sites included within each definition (see Table S1 for details) for gamma diversity at (A) species- and (B) family-level. Filled circles are urban pond samples, open circles are non-urban pond samples.*

*Table S3: Sensitivity analysis showing the variation in relative gamma diversity in ponds categorised as “urban” or “non-urban” using different thresholds (see Table SI for definitions of the assumptions).*

Taxonomic level	Assumption	Urban gamma	Urban SE	Non-urban gamma	Non-urban SE
Species	1	497	27	566	25
